

Screenshot 1: AI-generated dashboard layout

The AI assistant was prompted to outline a budgeting dashboard in Vite and TypeScript. It suggested the layout structure, summary cards, and transaction table. The outcome guided the final UI hierarchy used in the project.

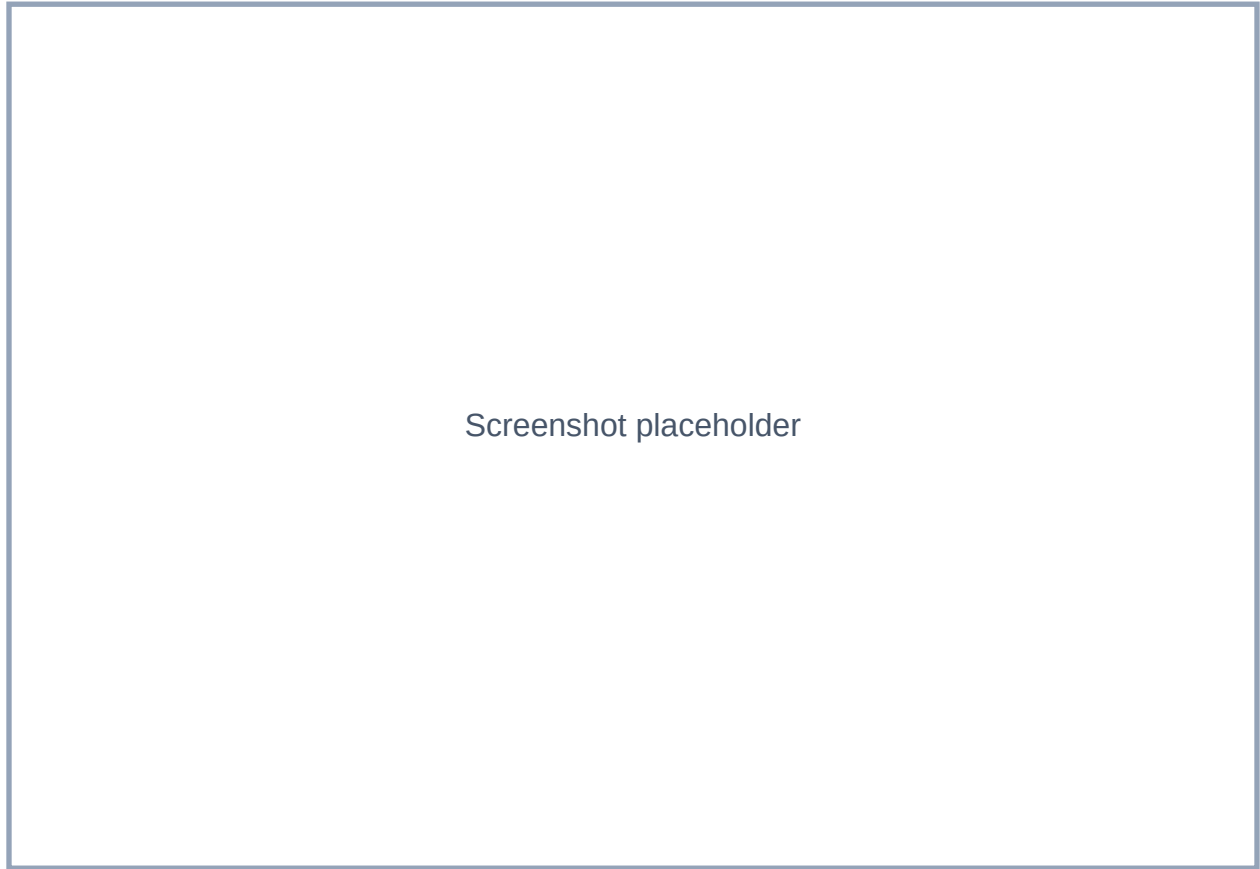

Screenshot 2: AI refactor of formatCurrency

Screenshot placeholder

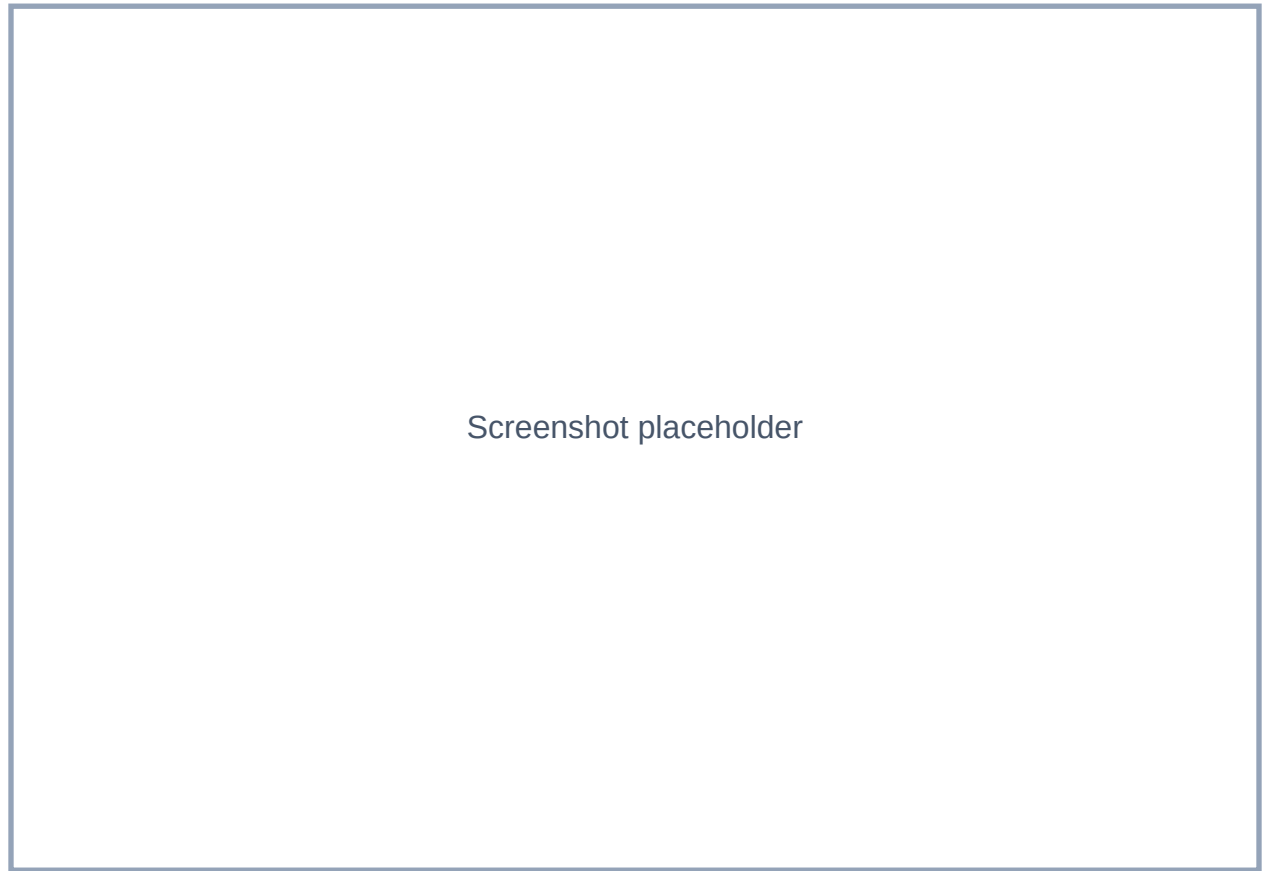

I asked the AI to refactor the `formatCurrency` helper for clarity. The response proposed using `Intl.NumberFormat` with explicit defaults and a reusable formatter. This improved readability and kept formatting consistent.

Screenshot 3: AI-generated unit tests

The AI was asked to draft tests for at least five finance utilities, including edge and invalid cases. It produced Vitest scenarios for totals, validation, category summaries, and snapshots. The tests were adapted and committed to the suite.

Screenshot 4: AI-assisted CI/CD pipeline

The AI helped design a GitHub Actions pipeline that runs lint, test, build, and deploy steps. It recommended npm caching and the GitHub Pages deploy actions. The resulting workflow now automates the deployment to a live URL.
